SELECTED PARKING COUNTS IN DOWNTOWN AMHERST

Amherst Planning Department
June 1997

SELECTED PARKING COUNTS IN DOWNTOWN AMHERST

Introduction

As part of its ongoing analysis of parking in downtown Amherst, the Planning Department conducted parking count surveys from December 1996 through March 1997. This report provides information regarding those counts. In the Appendix, detailed information is provided by time of day, locations of parking and percent of parking capacity.

How Counts were Done

Where - Counts were taken in the Boltwood Walk, CVS, Amity and Town Common lots--the three potential parking garage sites and the most central and most visible downtown parking lots. They include the largest downtown public parking lots, totalling over 400 parking spaces. They are in or near the densely developed blocks of the southern end of the downtown, which collectively generate over 70% of all downtown parking demand.

In the Boltwood Walk, CVS and Amity sites, subsections of lots were counted separately, to allow for more detailed analysis. See Maps 1-4 for specific areas and details.

When - Parking counts were taken on weekdays during the holiday shopping season, during the January 1997 school break, and in February and March after the schools, colleges and University were back in session.

To measure parking needs throughout an average day, counts were taken in the early morning (8:30 a.m.), during the lunch hour (12:30 p.m.), at mid-afternoon (2:30 p.m.) and late afternoon (4:30 p.m.). On Thursdays and Fridays, counts were also taken during the beginning of the dinner hour (6:30 p.m.).

The results of these counts were analyzed to show: 1) **average occupancy** (by time of day and calendar period); 2) **peak occupancy**, and; 3) **parking patterns within sites**, where the data showed that to be of significance.

Average Occupancy

Average occupancy figures are shown on Figures 1-4, which document averaged occupancies for different sites during the three calendar periods in which counts were taken. During all periods, Boltwood Walk had the highest, most consistent average occupancy levels, verifying parking demand projections made for that block. The Town Common lots were next highest,

followed by the CVS and Amity sites.

It should be understood that averaging parking count data tends to "flatten out" those counts which represent peaks or "valleys" of occupancy. While this provides a good overall measure of occupancy, it may also serve to obscure important information. This is why peak occupancies and subsection patterns were examined (see next section). A full listing of all individual parking counts (shown as percentages of occupancy for the subsection counted) is included in the Appendix.

In terms of daily patterns, as Figures 1-4 illustrate, all four sites have consistently low parking demand early in the morning, moderate to occasionally high demand in mid- or late afternoon, and higher demand (sometimes including illegal parking) during lunchtime and the dinner hour.

Peak Occupancies & Patterns Within Selected Sites

The size and frequency of peak occupancies are of particular importance, because peak occupancies are the levels of demand a public parking system must be designed to meet. A rule of thumb among parking professionals is that repeated occupancies at or above 85% at peak times are an indication that a parking lot or facility is approaching its capacity, and new parking supply is needed. To indicate the relationship between peak average occupancies and this measure of approaching capacity, an 85% line is shown on Figures 1-6.

Holiday & School Break

During the December 1996 holiday shopping season, both Boltwood Walk and CVS had peak average occupancies above 95%. During the January break, only Boltwood Walk and the Town Common lots had peak average occupancies above 90%.

Spring Semester

The spring semester typifies parking patterns during most of the year in Amherst, where schools are in session 8 months out of the year. Sixty-four separate counts were taken of each area during this period. Since February 4th, average occupancy in Boltwood Walk, the Town Common lots and the CVS site regularly exceeded 85% during peak times, usually lunchtime and dinner. It is worth examining the specific frequency of these times of peak occupancy, because they indicate how often an area's capacity is being approached or exceeded.

Table 1 shows the frequency with which parking exceeded the 85% peak in the major off-street parking area during the spring semester.

Table 1. Frequency of Occupancies Over Peak (85%) Level

SITE	% of Time Over Peak
Boltwood Walk	47%
Town Common	45%
CVS (56 private spaces only)	97%
Amity (34 public spaces only)	63%

Parking Garage Sites

Boltwood Walk - During the spring semester, twenty-four counts (38% of the 64 total counts) were between 85%-99% occupancy and six (9.4% of all counts) exceeded 100% occupancy. Taken together, these figures indicate that parking in the entire Boltwood Walk area is near, at or above capacity almost half (47%) of the time. There were no significant variations in parking patterns within the site--most subsections experienced the same high parking demand.

CVS Site - In the CVS site during the spring semester, nine counts (14% of all counts) were between 85%-99% occupancy and one count (1.5% of all counts) exceeded 100% occupancy. This would seem to indicate that the site was near, at or above capacity about 16% of the time. But this apparently low level of occupancy is deceptive. The CVS site includes public and private parking areas (see Map 3), which receive markedly different levels of parking demand.

Average parking occupancies for the subsections of the CVS site during the spring semester are shown on Figure 5. They indicate that the CVS site has a high parking demand--many people park there and, by implication, even more people try to park there. But they choose the 51 free private parking spaces (43% of the total), instead of the 69 metered spaces in the Town lot.

In the private areas, seventeen counts (27% of all counts) showed parking levels between 85%-99% occupancy during the spring semester, and a whopping forty-five counts (70% of all counts) showed parking levels above 100% (many above 110%), including pervasive illegal parking in unmarked areas and marked handicapped spaces. These areas of the site, which represent almost half of site parking, are near, at or above capacity 97% of the time.

This high level of parking demand tends to counter the perception that the CVS lot is hidden, hard to find and under-used. Many people are looking for and finding parking in the CVS lot; they just choose free, unregulated parking over regulated, metered parking. However,

employees of adjacent businesses and/or UMass commuters using this private parking all day probably contribute a 'base' level of parking that inflates these occupancy figures.

The adjacent Town lot had only two occasions (3% of all counts) during this period when occupancy exceeded 85%. Occupancy in the Town lot was often below 50%. The presence of immediately adjacent free parking and the perceived inconvenience of the central meter machine probably contribute to this low occupancy.

Amity Site - No counts for the entire Amity site showed parking occupancies above 85%. But counts for the separate public and private areas of the site (see Map 4) show a markedly different pattern. Average parking occupancies for the subsections of the Amity site during the spring semester are shown on Figure 6.

Parking demand in the Amity site can best be assessed in the 34-space Town lot next to the Amherst Cinema--it is the only parking on the site available to the public. Demand for parking in this lot is high. In the Town lot, thirty counts (47% of all counts) showed parking levels between 85%-99% and ten counts (16% of all counts) showed occupancies over 100%. Parking in this lot is near, at or above capacity 63% of the time. But the Town lot is small, and is the most visible lot serving the Jones Library (which receives an average of over 8,000 visits per week). It also represents only 27% of the total parking spaces on the site.

The 91 parking spaces in two private lots on the Amity site are set aside for Fleet Bank and SIS Bank employees, and were usually 40-60% occupied.

Summary

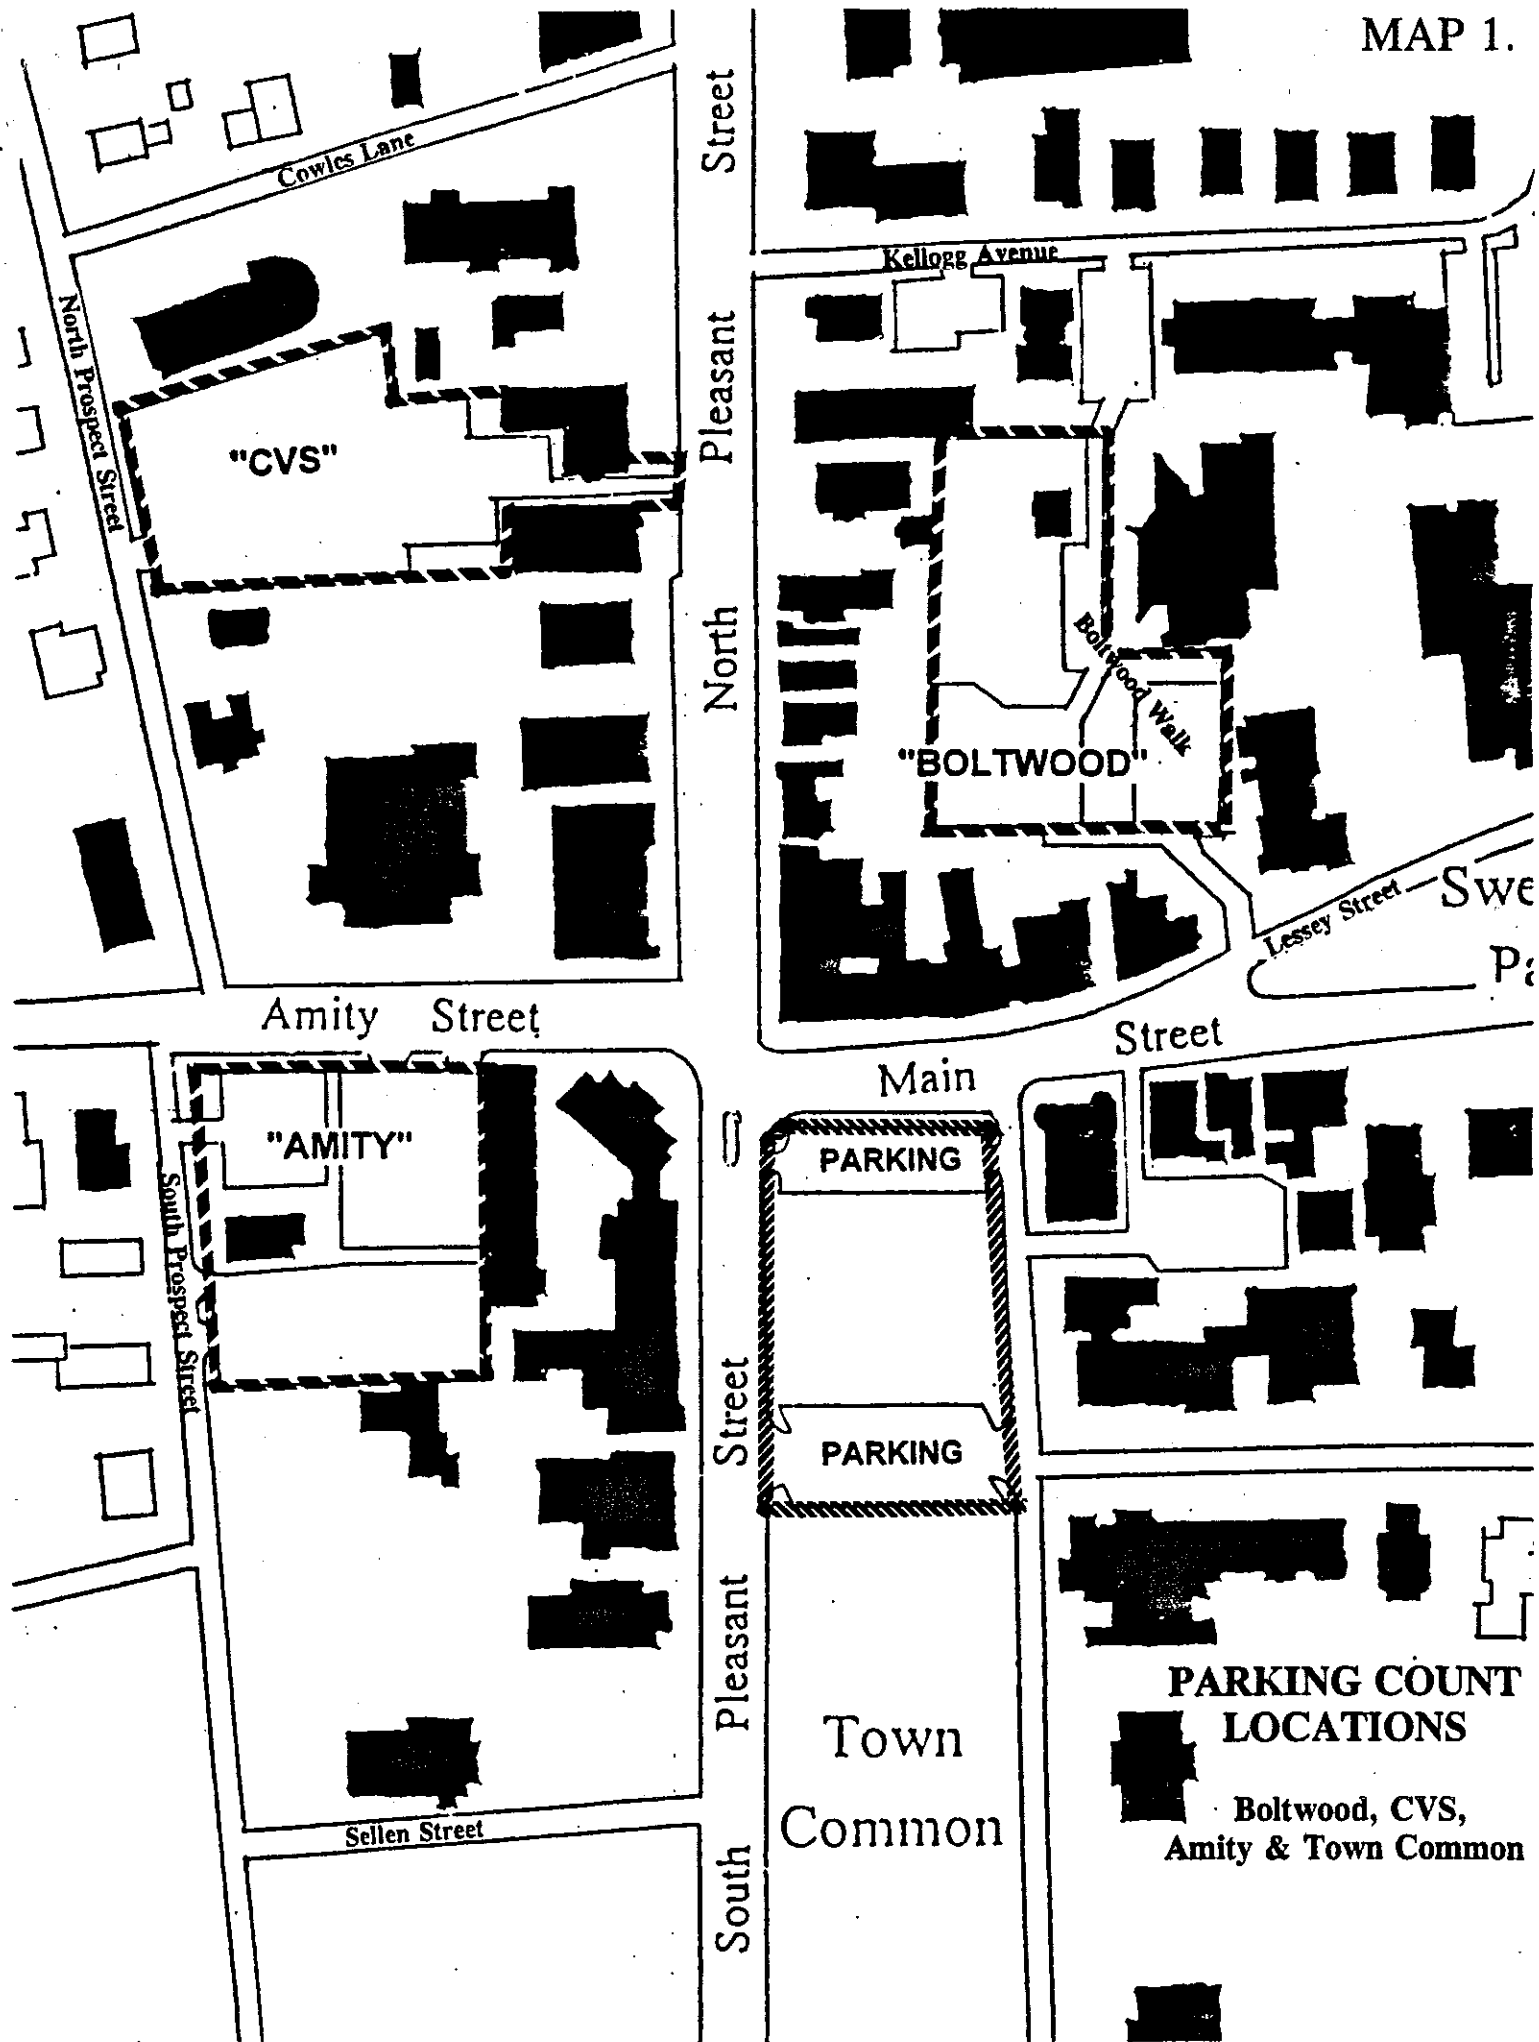

The parking count data show Boltwood Walk as having the highest consistent occupancy in an entire site. This confirms both the theoretical parking demand projections for Boltwood Walk (which show an adjusted block deficit of about 440 spaces) and many Amherst residents' direct experience of trying to park in this block. The parking count data confirms that locating the first downtown parking garage in Boltwood Walk will help address the greatest existing need.

The parking count data also shows that parking in the Town Common lots, CVS and Amity lots as often approaching or above capacity, and indicates a fairly consistent, high level of parking demand throughout the most developed section of the downtown. It also supports the overall conclusions of parking demand analyses conducted in 1977, in 1984 and again in 1997. Downtown Amherst's parking supply is not adequate to meet the existing, growing parking demand. Because the current demand overwhelms the current supply, downtown Amherst is becoming increasingly difficult for citizens and visitors to use.

Amherst has not built a single new parking space in 20 years. New parking supply is needed to provide for the long-term viability of Amherst's Town Center.

Downtown Amherst is relatively small, narrow and confined by residential neighborhoods to the east and west. Only a few areas within the downtown can accommodate significant new parking facilities. These few areas represent a critically important, limited resource for Amherst--their development will determine the future viability of this Town's center. Responsible development of these sites must include new parking facilities that add enough new parking to meet existing and future parking needs, needs that have now been documented by both parking demand studies and parking counts.
